

Logic First: Click Handler and Alert Call

1. Button ko select karna:

Sabse pahlay HTML button ko JS may access karay gay.

`const btn = document.getElementById("testbtn");`
`getElementById()` ki help say hum HTML may jis button ki id testbtn hai, usko find kar rahay hain or btn variable may store karay hay.

2. Button par click event lagana:

`btn.addEventListener('click', function() {`

`addEventListener` ka use kisi event ko detect karnay kay liya hota hay.

btn → hamara button

click → event ka naam

`function()` → click honay ka bad jo code chalayga

3. Input ki current value lana:

`let value = input.value`

Input field kay andar user may jo current value type ki hay value us ko read karay ga. or value variable may takhay ga.

4. Alert may value show karna:

`alert (value);`

`alert()` aik pop-up message show karta hay.

5. Click handler ko close karna:

`3); // Click event kay andar jo function tha end hogaya.`
